

Fig. 6-39 (a) A badly adapted bridge. Short canal treatment on the right lateral incisor with a huge bone lesion that involves the central incisor and cuspid and showing no kind of bone trabeculation in the center. (b) Palatal mucosa can be clearly seen through the buccal bone plate perforation. (c) and (d) Two Guidor resorbable membranes were used, one against the palatal mucosa and bone plate and another against the buccal bone plate. (e) to (g) Radiographic follow-up at 1, 3 and 5 years.
